How to check the static is working

Use the test light LED - provided.

Attach the light to the metal probes - select Static Mode - you can see static symbol on the screen - press the LAUNCH button - the LED will flash on.

Select a low number on the LCD display - put your fingers on the metal probes and press the launch button.

Notes for use:

1. The lifetime of the batteries vary according as how often you use the product therefore you should often check the batteries by watching the indicator light in the receiver and the indicator sign on the LCD screen of the transmitter.
2. The valid distance of remote control means the straight-line distance between the transmitter and the receiver without obstacles. If there are interference signal or signal screening around, the actual remote control distance may vary.
3. This product is for pet training. Only by training, the pet can understand the intention of its owner. Good effect can only be achieved after a period of training.
4. Training sessions should be kept positive and short, about 10-15 minutes long each time.
5. Presently, this product is the most effective and safest tool for training pet. Following the correct operational instructions, you can effectively train the pet and bring it no harm.

1. Condition your dog to the remote collar, or electronic collar, by allowing him to wear it while doing something he enjoys instead of only putting it on directly before training. Also, keep the transmitter with you even when you are not training. This will help prevent him from associating the stimulation he receives to the collar or the transmitter.
2. Since the stimulation (sometimes incorrectly called a shock) from the remote collar, or electronic collar, is Non-directional, always use it with a long - line or leash and away from people and other animals. Assisting your dog with a leash will also help him learn faster. Do not use the remote collar without a leash or long line until your dog is fully trained.
3. Always use the lowest stimulation level from the remote collar, or electronic collar, as possible for your dog. When choosing the right level of stimulation, begin at level one. If your dog shows no reaction (turns head, scratches at collar, flicks ears, etc.), go up one level until you find the proper level. Your dog should not vocalize or panic during the stimulation. If this happens, the stimulation level is too high.
4. Never use the remote collar, or electronic collar, to correct or eliminate any form of aggression or biting behavior. In the event your dog is exhibiting such aggressive behaviors, contact a qualified professional trainer in your area.
5. Start with behaviors your dog already understands - do not use the remote collar, or electronic collar, to reinforce commands that have not yet been covered. If your dog gets confused, help him with the leash and plenty of praise. When reinforcing a command with a correction, it is critical that you do so without emotion, then immediately praise and reward your dog for making the right decision.
6. Training in new locations may cause your dog to become distracted, causing you to reinforce your commands with the remote collar, or electronic collar, more often as a result. The level of stimulation may also need to be adjusted up or down, depending on the exercise or distraction level. It is important that you use a leash or long-line to help your dog perform his commands in new locations.

Training sessions should be kept positive and short, about 10-15 minutes long, so your dog will focus his attention on you. Look for all positive changes in your dog's behavior and be sure to reinforce them with plenty of praise. Remember to always end your training session on a high note. Stop training and play with your dog as soon as he has accomplished a new level of proficiency.

Frequency: 433.825MHz
Transmitter: 1604D 6F22/9V
Receiver: 2xAAA/1.5V

Made in China

Note: Please take out the batteries if you don't use it for a long time.
